New recombinant expression construct, useful for identifying compounds that inhibit the induction of genes induced by cyclin-dependent kinase inhibitors for preventing or treating cancer, renal failure or Alzheimer's disease.

Example 11; Page 133; 137pp; English.

The present invention relates to a recombinant expression construct encoding a reporter gene operably linked to a promoter from a mammalian gene induced by a cyclin-dependent kinase (CDK) inhibitor. The construct is useful for identifying compounds that inhibit the induction of genes induced by CDK inhibitors. The compounds are useful for preventing or tracting a disease caused by CDK inhibitor induced gene expression, e.g. cancer other than colon cancer, renal failure, Alzheimer's disease, amyloidosis, age-related diseases, atherosoclerobis or arthritis. The present sequence is a PCR primer used to amplify a human promoter suitable for use in the construct of the invention

The invention relates to a method of measuring beta 1,4-N-acetylgalactosaminyltransferase (GD2/GM3 synthase) mRNA. The method involves obtaining an mRNA sample, performing real-time quantitative reverse transcriptase-polymerase chain reaction (RT-PCR) on the sample using appropriate primers of GD2 synthase, and determining the amount of GD2 mRNA. The methods and kits are useful for detecting and/or diagnosing various forms of cancer such as neuroblastoma, melanoma, B cell lymphoma, osteosarcoma, soft tissue sarcoma, medullablastoma, high-grade astrocytoma, retinoblastoma, Wilm's tumour, Ewing's sarcoma, bladder carcinoma, lung cancer, breast cancer, pancreatic cancer, oseophageal cancer, pastrointestinal cancer, sarcoma, head and neck tumours or melanoma. The present sequence is BACE marker gene specific RT-PCR primer, used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "phosphorothioate backbone, nucleotides 1-5 and 16 -20 are 2'-methoxyethoxy (MOE) nucleotides, nucleotides 7

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel recombinant blood coagulation factor VIII, its production process and its medicinal composite for treating type-A haemophilia. The invention further comprises a medicinal composition containing the blood coagulation factor which promotes blood coagulation to the blood plasma of type-A haemophilia patients. This polynucleotide sequence represents an oligo relating to the recombinant blood coagulation factor VIII protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant blood coagulation factor VIII and its production process and medicinal composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Beta 1, 4-N-acetylgalactosaminyltransferase; GD2 synthase; GM2; RT-PCR; reverse transcriptase PCR; medullablastoma; astrocytoma; retinoblastoma;

This invention describes a novel compound, 17-50 nucleobases in length which specifically hybridises with a nucleic acid encoding human bitch specifically hybridises with a nucleic acid encoding human bitch solutions appoptosis regulator (BAR) and inhibits the expression of human BAR. The products of the invention have cytostatic and antiinflammatory activity and can be used to inhibiting the expression of during antisense therapy, useful for inhibiting the expression of human contains an animal, particularly a human suspected of having expression of BAR in an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of human baR. In addition the antisense oligonaclecities are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumor formation. The coligonuclecities described in the invention human BAR antisense oligonuclecities and a deoxy gap. This sequence represents a human BAR antisense oligonuclecities described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      . . .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, antisense, lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initialion coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of installation codon, coding region, 5' or regions within 2-10 mucleotides of chast all airway dysfunctions and a second active agent comprising an antiinflammatory steroid and ubjoinform. A composition of the invention has antiinflammatory antiallargic, antiasthmatic, hypotensive, as a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of or reducing sensitivity to adenosine, reducing levels of ubjquinone or lung surfactant in a subject, to treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                           Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; broncholilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of Junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubsquinone. A composition of the invention has mutinflammatory, antiallergic, antiasthematic, hypetensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also cor enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubsquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition.

Specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Seguence 20 BP; 2 A; 9 C; 5 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  at ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone

Disclosure; SEQ ID NO 4067; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation cooden, coding region, 5' or 3' end genemic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal alrawy dysfunction and a second active agent comprising an antiminamatory steroid and ubjudinton. A composition of the invention has antiminamatory, antiallergic, antiasthmatic, hypotensive, communication subjects of an antiminamatory antiallergic, antiasthmatic, hypotensive, as use in antistense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, as 180 or canding sensitivity to adenosine, reducing or depleting levels of antiminamatory steroid in a subject, for reducing or depleting levels of a denosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubjquinome or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allamation, lung allamation, shear is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
first active agent comprising an interpolation and intration codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encodings a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an intilifiammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchocanstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence date for this parent is not represented in the printed of specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating ailments associated with impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel pharmaceutical composition, which has a

Katz E,

Pharmaceutical composition for treating allments associated with impaired or respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone.

Disclosure, SEQ ID NO 7659; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the intitation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an artification and associated with lung and/or nasal airway dysfunction and biquinone. A composition of the invention has mutinflammatory antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisers gene therapy. The composition may have a use in antisers are piratory, lung or malignant disease or condition, also preventing a respiratory, lung or malignant disease or condition, as a continulammatory steroid in a subject, for reducing or depleting levels of or enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of adenosable receptor, producing bronchodilation, increasing levels of adenosable receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

treating ailments associated with impaired or respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid Pharmaceutical composition for ubiquinone

Disclosure; SEQ ID NO 8092; 872pp; English.

intiation relates to a movel phratmaceutical composition, which has a initiation codon, coding region, 5' or 3' end genomic flanking regions, 6' or 3' end genomic flanking regions within 2-10 mucleotides of increase ancoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory staroid and ubiquinone. A composition of the invention of the antiinflammatory, antiallergic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an infilammatory staroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition.

So precification, but was obtained in electronic format directly from WIPO or security in the printed or security. invention relates to a novel pharmaceutical composition, which has a at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                 The invention relates to preventing desulphurization of an oligonuclectide or its bioequivalent comprising one or more phosphorothicate linkages in a bi-phasic or multi-phasic formulation. The method involves including in the formulation an anticoxidant which partitions into the aqueous phase of the formulation. The method is useful for increasing the stability of oligonucleotide comprising phosphorothicate linkages. The present sequence represents a 2-decoxyoligonucleotide having a phosphorothicate backbone and is targeted to the 3' UTR (untranslated region) of ICAM-1 (intercellular adhesion
                                                                                                                         Preventing desulfurization of oligonucleotide comprising phosphorothioate linkages in bi-phasic/multi-phasic formulation, by adding to formulation an antioxidant that partitions into aqueous phase of the formulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human HSL chimeric phosphorothioate oligonucleotide SEQ ID NO:106.

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises with an least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding HSL. (I) have anorectic, antidabetic and cytostatic activities, and can be used in antisense therapy. (I) is useful for treating an animal, particularly human, suspected of having an abnormal metabolic condition such is obesity, hypertipidaemia, type 2 diabetes, a hyperprisiferative disorder such as cancer (e.g. pituitary, colorectal, breast, testicular, pulmonary or epithelial cancer). (I) is also useful in modulating blood glucose levels particularly plasma or serum glucose levels, in a diabetic animal. The present sequence represents a human hormone-sensitive lipase chimeric phosphorothioate antisense oligonucleotide, which is used in an example from the present invention

Pulsed release oral formulation providing enhanced gastrointestinal absorption, comprises first particles containing drug and penetration enhancer and second particles containing delayed release penetration

Disclosure; Page 28; 59pp; English.

The present invention describes a delayed release oral formulation (A), giving enhanced gastrointestinal (GI) absorption of a drug (I). (A) comparises a first set of particles containing (I) and a penetration comparises a first set of particles containing (II) in a delayed release coating or matrix (III). (A) is used for enhancing the absorption of [I] in mammals, especially humans. Typical disorders to be treated include ulcerative colitis, rheumatoid arthritis, Crohn's disease, inflammatory bowel disease and abnormal cellular proliferation. When the particles release (I) and (II) at a first location in the GI tract clease pulse) and is often present in insufficient amount to promote absorption of the entire dose of (I). This problem is solved by providing further (II) in delayed release form in the particles, so that absorption of (I) is completed in a second buse. The present sequence represents an exemplary oligonucleotide from the present invention which inhibits ICAM-

Vogelstein B, Kinzler KW, Saha S, Bardelli A; 4PI; 2003-393457/37. Identifying regions of neoplastic growth in a human body, useful for detecting or predicting metastasis, comprises administering to the human body an antibody or peptide that specifically binds to a protein marker of neoplastic growth.

Example 2; Page 22; 42pp; English

The invention relates to methods for identifying regions of neoplastic growth in a human patient, especially for detecting or predicting or metasates. The methods involve determining whether a neoplastic growth marker protein is overexpressed, either by the use of an antibody specific for the protein, or by the use of FCR or hybridisation to detect nucleic acids encoding the marker proteins. A set of neoplastic growth markers are disclosed (SAGE (serial analysis of gene expression) tags for these are given in ADA26759-ADA26796), with protein tyrosine phosphatase type IVA member 3 (also known as FRL-3) being a preferred neoplastic growth marker. The neoplastic growth markers are specifically expressed at a higher level in metastatic cancers. Compared with advanced and early growth markers are specifically expressed at a higher level in metastatic cancers. The invention also oversypression of the neoplastic growth markers is taken as an indication oversypression of the neoplastic growth markers is taken as an indication that the tissue has a propensity to metastaise. The invention also cancer, and for identifying candidate drugs for treating advanced or metastatic cancers. The methods of the invention are useful for identifying regions of neoplastic growth, for detecting or predicting metastasis, or identifying candidate drugs for treating advanced or metastatic cancers. The invention is particularly applicable to metastatic cancers. The invention is particularly applicable to metastatic cancers. The invention is particularly applicable to metastatic imaging and for targeting orthocial cancers. Antibodies which bind to the neoplastic growth marker proteins are additionally useful for diagnostic imaging and for targeting orthocial cancers. The invention relates to an oligonucleotide 8-50 nucleotides in length which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction. regulating cell proliferation and which is capable of inhibiting the expression. Also included is a composition comprising the oligonucleotide and a pharmaceutically acceptable carrier. The antisense oligonucleotide is useful for inhibiting the expression of human raf in human cells or issues, by contacting the human cells or tissues with the oligo. The oligo. is also is useful for treating or preventing a disease or condition with a chemotherapeutic agent to a human or cells of the human, where the expression of raf by administering it in combination with a chemotherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a neovascularisation (preferably coular angiogenesis or neovascularisation). The oligo, is also useful for inhibiting hardered example for detecting and determining the role of raf expression in various cell functions and abhalological processes and conditions and physical processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present sequence is an antisense oligonucleotide targeting
                                                                                        Novel antisense oligonucleotide which is targeted to mRNA encoding human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnosing conditions associated with raf expression and for research purposes. The present sequence is an antisense oliconucleotide target
                                                                                                                                             raf and which is capable of inhibiting raf expression, useful for
treating or preventing hyperproliferative conditions such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.8%; Score 13.6; DB 1; Length 20; ilarity 80.0%; Pred. (HOFF) ROCHE DIAGNOSTICS GMBH. (HOFF) HOFFMANN LA ROCHE & CO AG F.

The sequences given in ABQ80141-52 represent primers which were used to identify wild type and variant loci in the human interleukin 4 receptor CC (ILAR). These primer sequences were used in the method of the invention of determining an individual's risk for type 1 diabetes. The method comprises detecting the presence of an insulin dependent diabetes comprises detecting the presence of an insulin dependent diabetes comprises detecting the presence of the allele in a nucleic acid sample of the individual, where the presence of the allele indicates the individual's risk for type 1 diabetes. The method identifies one or comprises in the fort type 1 diabetes are useful for determining an individual's risk for any autoimmune disease or condition or any T helper type 1 mediated disease, systemic lupus cor any T helper type 1 mediated disease, systemic lupus cor any T helper type 1 mediated disease, systemic lupus cor any T helper type 1 mediated disease, systemic lupus corpusing myasthenia gravis, gclerosis, scleroderma, Grave's disease, systemic type in thy colditis comprises detecting Determining an individual's risk for type 1 diabetes, comprises detecting the presence of an insulin dependent diabetes mellitus-associated interleukin 4 receptor allele in a nucleic acid sample of the individual. Example 4; Page 35; 79pp; English. WPI; 2003-248086/24.

The present invention describes an oral pharmaceutical formulation (I) for delivering a bioreactive macromolecule to a mucosal surface. (I) comprising a pipulation of carrier particles comprising drug and a bioaddesive compound; and a second population of carrier particles comprising a penetration enhancer. Also described is a method for enhancing the mucosal absorption of the bioactive macromolecule in a mammal (preferably a human) by mucosally administering (I). (I) has artilloer, antiliflammatory, antilheumatic, antiarthritic and cytostatic activities. (I) can be used for delivering a bioreactive macromolecule to a mucosal surface. It is used for the oral delivery of a drug to an animal encompassing a human as well as other mammals, reptiles, fish, amphibians and birds. It is used to deliver drugs including peptiles, proteins, monoclonal antibodies their fragments, nucleic acids (DNA and RNA), oligonucleotides, antisense oligonucleotides, and small molecules. It can be used to examine the function of various proteins and genes in an animal, including those that are sessential to animal development. It can be used for the treatment of animals that are known or suspected to suffer from any disease treatable with the inventive composition, e.g. ulcerative collits, rheumatodid arthritis, crobin's disease, inflammatory obeyel disease, or undue cellular proliferation (cancers and tumours). The present sequence represents an exemplary oligonucleotide from the present invention, which can be used to inhibit ICAM-1
                                                                                       Oral pharmaceutical formulation for delivering bioreactive macromolecule to mucosal surface, contains drug, bioadhesive compound, and penetration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR; primer; Vpr; ss; immune response; immunocompromise; HIV; cancer; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention relates to a DNA or RNA construct capable of expressing interleukin (IL)-2 in a warm-blooded animal or biological preparation, comprising a Vpr activated promoter, a transcribable DNA segment coding for a signal peptide functional in mammary cells and operably linked between the promoter and the DNA segment to facilitate secretion of IL-2. The construct is useful for increasing the immune response of a warm-blooded animal or biological preparation, by introducing the construct in stem cells, antigen preparation, by introducing the construct in stem cells, antigen corresponse of a warm-blooded animal or biological preparation to obtain a calls, of the warm-blooded animal or biological preparation. The warm-blooded animal is an immal or biological preparation. The warm-blooded animal is an immunocompromised patients. The method is useful for stimulating immune response in immunocompromised patients. The present sequence represents and diven construct associated primer. Note: The present sequence is made to it is the sequence listing but no further reference is made to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                              Novel DNA or RNA construct for increasing immune response of warm-blooded animal, has Vpr activated promoter, DNA segment encoding interleukin 2 and secretory DNA encoding signal peptide functional in mammary cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            'n

The specification describes a method of analysing DNA or RNA targets. The method comprises contacting the targets with oligonucleotide probes attached to an enzyme cofactor marker which is recognized less by the enzyme when it is on a free oligonucleotide than when it is on a hybridized oligonucleotide. The method is useful for analysing DNA or RNA targets. The invention is used to determine the amount of a target nucleic acid in a biological sample and the level of complementarity between the probe and the target nucleic acid. The present sequence represents an oligonucleotide probe attached to flavin. an enzyme cofactor marker for flavin reductase. The probe, together with its complement ABZ77540, was used to study the activity of flavin reductase
                                                                                                                                                                                    Analyzing DNA or RNA targets, useful for determining nucleic acid in a
biological sample, comprises using probes marked by a cofactor for an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antisense compound that is targeted to a nucleic acid encoding inhibitor-kappa B Kinase-gamma, specifically hybridising to the nucleic acid encoding inhibitor-kappa B Kinase-gamma and inhibiting its expression. Compounds of the invention are antisense cligonucleotides comprising at least one modified internucleoside invention are antisense cligonucleotides comprothioate linkage, at least one modified sugar modety, which is a 2-0-methoxyethyl sugar modety, or at least one modified nucleobase, which is a 5-methylcytosine. Preferably, the modified nucleobase, which is a 5-methylcytosine. Preferably, the invention is useful for preparing a composition for treating a hyperproliferative disorder e.g., cancer, or an autoimmune or hyperproliferative disorder e.g., cancer, or an autoimmune or inflibitor-kappa B Kinase-gamma in cells or tissues, and treating an animal having a disease or condition associated with thibitor-kappa B kinase-gamma. Sequences given in ADA44713-ADA44790 represent antisense oligonucleotides for the inhibition of human mRNA levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                  New compound having sequence targeted to nucleic acid encoding inhibitor-kappa B kinase-gamma, useful for preparing composition for treating e.g., cancer, or inflammatory or autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe; enzyme cofactor marker; enzyme; flavin; flavin reductase; ss.

Example 1; Page 33; 52pp; Japanese.

The present invention describes a substrate having a number of ligands which have been immobilised onto a predetermined region of its surface, in which the region on the substrate has such a shape as to allow the concentration of signals caused by binding of the ligands to receptors in the region toward the receiver. Also described is a substrate for the immobilisation of such ligands. The substrates are applicable in general information of such ligands. The substrates are applicable in generalization of such ligands. The substrates and biological activity e.g. effect of endocrine disrupters on various genes and also in investigating the effect of hormones, drugs and other chemicals on the environment. Such substrates are highly sensitive in detecting the ligand-receptor binding, with affinity and reproducibility. The ligandimmobilised substrates can be produced in high density e.g. in microarray form to provide finely tuned results. ADA00221 to ADA00282 represent PCR prometry. New synthetic oligonucleotide complementary to nucleic acids encoding epidermal growth factor receptor (EGFR), useful for inhibiting the EGFR gene or mRNA expression, and reducing cancer cell proliferation.

Claim 10, Page 12; 36pp; English.

complementary to a region of nucleic acid encoding epidermal growth factor receptor (EGFR) with location 245-1117, 2407-3201, 3786-4102 or 4574-45633. The methods and compositions of the invention are useful for annancing inhibition of EGFR gene or mRNA expression, and reducing cancer cell proliferation, in particular cancer cells of the colon, ovarian or breast. Sequences ABZ23811-832 represent specific examples of such The invention relates to synthetic antisense oligonucleotides

New antisense compound, useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis.

Example 5; Col 27-28; 44pp; English

This invention describes a novel antisense compound, which is 8-30 mucleobases in length targeted to a nucleic acid molecule encoding p38 mitogen-activated protein kinase (MAPK). He products of the invention have antiarthitic and antihilammatory activity, can act as act as kinase inhibitors. The antisense compound is useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis or for use in antisense gene therapy. This sequence represents an antisense oligonucleotide used in a method to inhibit p38 MAPK

The antisense oligonucleotides were designed to target different regions of the human p70 S6 kinase RNA, and were analysed for their effect on mRNA levels by quantitative real-time PCR. p70 S6 kinase (also known as SK6, p70/p85 s6 kinase, p70/p85 ribosomal S6 kinase and pp70s6k) is a serinethreonine kinase responsible for the phosphorylation of the ribosomal S6
                                                                                                                                                                                                                                                                                                                                                              /note= "Phosphorothioate linkages. When bases 1-5 and 16-20 are not 2'-methoxyethyl (2'-MOB) nucleotides, all cytosines in the oligonucleotide are 5-methylcytosine"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense compound which is targeted to nucleic acid encoding p70 S6 kinase, and inhibits expression of p70 S6 kinase, useful for treating a condition associated with p70 S6 kinase, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "Optionally 2'-methoxyethyl (2'-MOE) nucleotides.
All 2' MOE cytosines are 5-methylcytosine"

protein, which in turn stimulates protein synthesis. p70 S6 kinase function is essential for cell cycle progression, and has also been implicated in the regulation of the immune response. p70 S6 kinase is itself activated via phosphorylation, a process influenced by upstream signalling cascades and by hyperinsulinaemia, and may play a role in the progression of colon cancer and in the development of lipotoxic disorders and obesity. The oligonoclecides of the invention are useful for the prevention and treatment of conditions associated with p70 S6 kinase, such as hyperproliferative disorders such as cancer, and metabolic disorders. They are also useful in research and diagnostics for modulating the expression of p70 S6 kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises DNA sequences that show enhanced expression in human neuroblastroma with good prognosis. The DNA sequences of the invention are useful in clarifying good/poor prognosis of neuroblastoma. The present DNA sequence was used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids isolated from neuroblastoma showing enhanced expression in human neuroblastoma with good prognosis, useful in clarifying good/poor prognosis of neuroblastoma and providing genetic data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Use of platelet-derived growth factor, vascular endothelial growth factor, or their modulators for modulating neural stem cell or neural progenitor cell activity, particularly for treating e.g. Alzheimer's, ischemia or stroke.

Example 11; Page 77; 119pp; English.

The sequences given in ABO80256-69 are primers which were used to identify the presence of vascular endothelial growth factor (VEGF), or the VEGF receptors, FIK1, FIT-1 and FIT-4 in human stem cells (BEC). The method of the invention for alleviating or reducing a symptom of a disease or disorder of the nervous system comprises administering prowth factor (VEGF), a combination of PDGF and VEGF, or a PDGF or VEGF agonist, to a patient in order to modulate neural stem cell or neural progenitor cell activity in vivo. The method is useful for alleviating or reducing the symptoms of a disease or disorder of the nervous system, e.g. neural progenitor disorders, neural stem cell disorders, neural progenitor disorders, neural stem cell disorders and enemory affective disorders, neuropsychiatric disorders or learning and memory affective disorders, neuropsychiatric disorders or learning and memory affective disorders, spinal cord injury, or cancer-related brain/ spinal cord injury, schizophrenia and other psychoses, depression, bipolar chancer, anxiety syndromes/disorders, appression, bipolar chancer, borderine personality disorder, cerebral palsy, life style disorder, borderline personality disorder, cerebral palsy, life style drug, multi-infarct dementia, Lewy body dementia, age related/geriatric

dementia, epilepsy and injury related to epilepsy, spinal cord injury, brain arelated brain/spinal cord injury, anti-cancer treatment related brain/spinal cord injury, infection and inflammation related brain/spinal cord injury, environmental toxin related brain/spinal cord injury, environmental toxin related brain/spinal cord injury, environmental toxin related brain/spinal cord injury, multiple sclerosis, autism, attention deficit disorders, narcolepsy or sleep disorders. The PDGF and/or VBGF, is useful in the manufacture of a medicament for alleviating or treating these diseases or disorders, accelerating growth of neural stem cells or neural progenitor cells, or inducing proliferation or differentiation of these cells. This primer gives an estimated band size of 378 bp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; CREB; cAMP response element binding protein; CREB1; bZIP; basic leucine zipper; transcription factor; intracellular signalling; spermatogenesis; circadian rhythm; memory; apoptosis; hyperproliferative disorder; cancer; tumour; blood; soft tissue; apoptosis related disease; neuronal disorder; chromosome 2q32.3-34; cytostatic; neuroprotective; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.

The invention relates to antisense oligonucleotides (ACF33752-ACF33779)
targeted to the human CREB (CAMP response element binding protein) gene,
which inhibit its expression. The oligonucleotides were designed to
target different regions of human CREB mRNA, and were analysed for their
effect on CREB expression by quantitative real-time PCR. CREB (also known
as CREB1) is a member of the basic leucine zipper (bZIP) family of
transcription factors, and activates transcription of target genes in
response to a diverse array of stimuli including peptide hormones, growth
actors and protein kinases. It is a component of intracellular
signalling events which regulate a wide variety of biological functions,
including spermatogenesis. Circadian rhythms and memory. Overexpression
of CREB has been found to induce apoptosis in certain cells, although
cresponse to drug dependency, as it has been found to mediate morphine-
induced upregulation of the CAMP pathways that contribute to opiate
development of drug dependency, as it has been found to mediate morphine-
induced upregulation of the cAMP pathways that contribute to opiate
dependency. The oligonucleotides of the invention are useful for
and soft tissuely, diseases or conditions arising from aberrant apoptosis,
or neuronal disorders (particularly cancer, e.g., those of blood
and soft tissuely, diseases or conditions arising from aberrant apoptosis,
or neuronal disorders The present sequence represents a human H-ras
phosphorothioate antisense oligonucleotide used as a positive control in
incention of the concentration for a particular cell

human neuroblastomas with poor prognosis over those with a good prognosis. The nucleic acids of the invention are useful as a tool for distinguishing neuroblastomas with a favourable prognosis (spontaneous regression) from neuroblastomas with a poor prognosis (high malignancy). The DNA sequences ABT32224 - ABT32571 represent oligonucleotides used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                                                                         BCL2-associated X, BAX; nootropic, neuroprotective; antiparkinsonian, anticonvulsant; ophthalmological; antidiabetic; virucide; antisense therapy; BAX antagonist; BAX inhibitor; familial amylotrophic lateral sclerosis; Alzheimer's disease; PaxKinson's disease; hodgkin's disease; cartilage-hair hyperplasis; adiabetes-associated ocular disorder; scrapie infection; aberrant apoptosis; human; phosphorothioate; ss.

```
The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding BCL2-associated X (BAX) protein, where the compound specifically hybridises with the mucleic acid molecule encoding BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition comprising (1) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (1); and (3) treating an animal having a disease or condition associated with BAX protein comprising administering to the animal (1) so that expression of BAX protein is inhibited. (1) has nootropic, neuroprotective, antiparxinsonian, anticonvulsant, ophthalmological, antidiabetic and virtugarishing and en be used in antisense therapy, and as a BAX antiagonist. The antisense compounds (1) are useful for modulating the expression of BAX protein, and for treating a disease or condition associated with BAX protein, and for treating a disease or condition associated with BAX protein, and for treating a disease or condition associated with BAX protein, e.g. familial amylotrophic lateral schedular hyperplasia, diabetes-associated ocular disorders or scrapie infection, or a condition that arises from aberrant apoptosis. The present sequence represents a human BAX chimmeric phosphorothhoate present invention.

or Alzheimer's disease

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding BCI2-associated X (BXX) protein, where the compound specifically hybridises with the nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition comprising (I) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (I), and (3) treating an animal having a disease or condition associated with BAX protein in comprising administering to the animal (I) so that expression of BAX protein is inhibited. (1) has nootropic, neuroprotective, antiparkinsonian, anticonvilsant, ophthalmological, antidiabetic and virtida antisense compounds (I) are useful for modulating the expression of BAX protein, and for treating a disease or condition associated with BAX protein, and for treating a disease or condition associated with BAX protein, and for treating a disease or condition associated with BAX protein, e.g. familial amylotrophic lateral cartiage-hair hyperplasia, diabetes-associated coular disorders or scraple infection, or a condition that arises from aberrant apoptosis. The present sequence represents a mouse BAX chimeric phosphorothioate present invention.

```
The present invention describes a compound (I) that is 8-50 nucleobases in length: (a) targets a nucleic acid molecule encoding major histocompatibility complex (MHC) class II transactivator, and inhibits the expression of MHC class II transactivator; or (b) specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding MHC class II transactivator. (I) has immunosuppressive, antimicrobial, mutilabetic, antirheumatic, antiarthritic, cytostatic, nootropic, neuroprotective and immunostimulan activities, and can be used as an MHC class II transactivator and immunostimulan activities, and can be used as an utilitiesnee oligonuclectides can be used for treating an animal having a disease or condition associated with MHC class II transactivator, e.g. autoimmune disorder or infection. The antisense oligonuclectides can be used for inhibiting the expression of MHC class II transactivator in cells or tissues. In particular, these diseases include transplant celts or inhibiting the expression of MHC class II transactivator in cells or tissues. In particular, these diseases include transplant multiple solerosis, or severe combined immunodeficiency disease. The antisense compounds are useful for diagnostics, prophylaxis, or as antisense compounds are useful for diagnostics, prophylaxis, or as antisense compounds are useful for diagnostics prophylaxis, or as creared reagents or kies. The present sequence represents a human MHC class II transactivator chimmeric phosphorothioate antisense invention or which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating MHC class II transactivator gene expression, particularly useful for treating autoimmune disorders such as transplant rejection, Alzheimer's disease, or multiple sclerosis,

```
The invention relates to antisense compounds targetted to the nucleic acid encoding the G protein-coupled receptor FTBR-LD-2 (endothelin type b receptor-like protein-2) to inhibit its expression. FTBR-LD-2 is also known as endothelin-binding receptor-like protein-2, FTBR-LIke protein 2 and G-protein coupled receptor 37 like 1 (FBR3/LI). Antisense compounds of the invention are useful for treating hyperproliferative disorders (especially cancer) and cardiovascular diseases especially angiogenesis, arthroposlerosis, hypertension, cerebral vascular disease, stroke and acute proliferative nephropathy. The present sequence is an antisense oligonucleotide targetted to human ETBR-LD-2 DNA
                                                                                                                 Human, G protein-coupled receptor; hyperproliferative disorder; GPR37L1; endothelin type b receptor-like protein-2; cerebral vascular disease; antisense; endothelin-binding receptor-like protein-2; atherosclerosis; cardiovascular disease; ETR-LP-2; G-protein coupled receptor 37 like 1, acute proliferative nephropathy; ETBR-like protein 2; cancer; stroke;
                                                                                                                                                                                                                                                                                                                                                                       /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotides which bind the nucleic acid encoding the G protein coupled receptor BTBR-LP-2 (endothelin type b receptor-like protein-2 receptor), useful for treating e.g. cancer and cardiovascular diseases.

The invention relates to antisense compounds targetted to the nucleic acid encoding the G protein-coupled receptor ETBR-LP-2 (endothelin type b receptor-like protein-2) to inhibit its expression. ETBR-LP-2 is also known as endothelin-binding receptor-like protein-2, ETBR-LP-2 is also and G-protein coupled receptor 37 like i (GR3711). Antisense compounds of the invention are useful for treating hyperproliferative disorders (especially cancer) and cardiovascular diseases especially angiogenesis, atherosclerosis, hypertension, cerebral vascular disease, stroke and acute proliferative nephropathy. The present sequence is an antisense oligonucleotide targetted to human ETBR-LP-2 DNA
                                                                                                                                                                                                                                                  Human, G protein-coupled receptor; hyperproliferative disorder; GPR37L1; endothelin type b receptor-like protein-2; cerebral vascular disease; antisense; endothelin-binding receptor-like protein-2; atherosclerosis; cardiovascular disease, ETBR-LP-2; G-protein coupled receptor 37 like 1; acute proliferative nephropathy; ETBR-like protein 2; cancer; stroke; anglogenesis; hypertension; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotides which bind the nucleic acid encoding the G protein coupled receptor ETBR-LP-2 (endothelin type b receptor-like protein-2 receptor), useful for treating e.g. cancer and cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

Novel isolated polynucleotide comprising a mouse or human familial combined hyperlipidemia 1 gene having a variation that is associated with a lipid disorder, useful for identifying susceptibility to the lipid

Claim 11; Page 40; 63pp; English

The invention discloses isolated polymucleotides comprising mouse HYPLIPI control as sequence, mouse HYPLIPI genomic DNA, or the homologous human channed mouse HYPLIPI genomic DNA, or the homologous human control and the sequence is associated with a lipid disorder. Also claimed is an isolated polyperlipidaemia 1 (FCHLI) game, where a variation in the sequence, or a variant form of a fully defined human FCHLI amino acid sequence, where the variant form of the mouse HYPLIPI amino acid sequence, where the variant is associated with the lipid disorder, an isolated polymucleotide having at least 12 contiguous nucleotides of the variation position, an isolated polypeptide comprising 4 contiguous amino acids of the encode polypeptides, where the 4 contiguous amino acids of the encode polypeptides, where the 4 contiguous amino acids span the variation position, a kit for the detection of the FCHLI locus comprising, an isolated anilody, identifying susceptibility to a lipid disorder which comprises comparing the nucleotide sequence of the difference between the suspected allele and the wild-type sequence identifies a sequence variation of FCHLI nucleotide sequence and a pharmaceutical composition. Also disclosed is a transgenic animal which carries an altered HYPLIPI or FCHLI allele and a method for screening drugs for inhibition or restoration of FCHLI gene function as an antilipid disorder associated with expression of FCHLI, for diagnosis or prognosis of predisposition to lipid disorder, and cancer and for prognesse of predisposition to lipid disorder, and cancer and for treating a lipid disorder such as familial combined hyperlipidaemia, occonary artery disease, atherogenic lipoporteinaemia, low density

```
ö
lipoprotein (LDL) subclass B, familial dyslipidemic hypertension, syndrome X, hypercholesterolaemia, obesity, insulin resistance and cancer. The sequence presented is a PCR primer which was used to amplify part of the mouse HYPLIPI locus.
                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                  ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Embryonic stem cell; ES cell; mouse; differentiation; nerve or

The present invention relates to a method of inducing differentiation of mammalian embryonic stem cells into functioning cells, which comprises culturing embryonic stem cells in a medium comprisely which comprises culturing embryonic stem cells in a medium comprise, the invention cator and basic fibroblast growth factor. In particular, the invention cells are to the differentiation of murine embryonic stem cells. The method is useful for inducing differentiation of mammalian embryonic stem cells. The method cells into functioning cells. Other methods are useful for treating a mammalian patient having disorders in pancreatic function, and in nerve function. The cells are pancreatic slet like cell clusters and nerve like cells. Functioning cells induced from embryonic stem cells using the present method may be used for treating disorders in pancreatic islet function creation disorders or disease), neuronal degeneration (e.g. Alzheimer's disease) cells are useful not only for cell transplant therapy, but for in vitro creation, and for safety evaluation of new drugs. The present sequence is a PCR primer used in the exemplification of the invention

Inducing differentiation of mammalian embryonic stem (ES) cells into functioning cells, for treating e.g. diabetes, comprises culturing ES cells in a medium containing leukemia inhibitor factor and basic fibroblast growth factor.

The invention discloses a method for amplifying expressed genetic sequences from genomic DNA (gDNA) from mammalian or higher order plant species. The method involves identifying a 3 untranslated region (UTR) of a gDNA sequence, designing probe, performing a second PCR to amplify product by size differentiation and performing a second PCR to amplify the predetermined sequence. Also claimed is a biological analysis device, comprising a substrate and an array of a set of expressed genetic sequences, located on the substrate, which are generated by the method are deposited an array of biosites of genomic DNA fragments having the sequence of at least one exon, and absent polyadenine and vector sequences to exon, and absent polyadenine and vector sequences where the genomic DNA fragments have a sequence length of from about 75-2000 nucleotides. The method is efficient for amplifying gene sequences, eaches a large-scale production of gDNA sequences, enables large-scale production of gDNA secuences is generated by including in microarray formats, fabricates high-density DNA arrays of printing in microarray formats, fabricates high-density DNA arrays of enhanced, watchy varying genetic content and abstains from using RNA-derived sequences by simple PCR amplifications without cloning. The method produces amplified sequences that have greater specificity and size consistency than that observed with cDNA fragments, and allows for is a Type II gene specific primer.
                                                                                                                                                                                                                                                                                                                                                                                    PCR; primer; ss; genomic DNA; gDNA; untranslated region; UTR; DNA high-density microarray; biosite; large scale production; gDNA probe; microarray; Type II primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amplifying expressed genetic sequences from genomic DNA of mammalian or higher order plant species for printing on DNA microarrays, involves using the 3' untranslated region of the gene sequence.

The invention describes an isolated polypeptide (I) comprising a variant form d a mouse HYPLIPI polypeptide sequence (S1) or a human FCHLI polypeptide sequence (S1) or a human FCHLI polypeptide sequence (S1) or a human FCHLI polypeptide sequence (S1) or diagram or a read or a sequence having at least 65 % sequence identify to (S1) or (S2). A composition comprising the expression of FCHLI. FCHLI gene or HYPLIRI gene and its product are useful for the study of metabolic pathway and cellular mechanism to identify other genes, receptors and relationships that contribute to lipid disorder and cancer. FCHLI gene or its fragments are useful in gene the ready to increase the amount of the expression products of the gene for the treatment of lipid disorder or cancerous cells. The sequence variation of FCHLI gene or HYPLIPI gene is also useful in the disgnosis and prognosis of predisposition to lipid disorder and cancer. Antisense collymuclectide sequences are useful in preventing or diminishing the expression of HYPLIPI or mouse HYPLIPI gene.
                                                                                                                                                                                                                               cytostatic, antilipemic; gene therapy; peptide therapy; HYPLIPI; FCHLI; cancer; metabolic pathway; cellular mechanism; lipid disorder; familial combined hyperlipidaemia; mouse; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human FCHLI or mouse HYPLIPI polypeptide, useful for drug
screening, peptide therapy of lipid disorder or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lusis AJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-3 nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnoshing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                  Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide with the antibody of the encoded by contexting the polypeptide or peptide with the antibody of the encoded by contexting the polypeptide or peptide with the antibody of the encoded by contexting the polynucleotide in an expressible manner and an antisense polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotide in an encoded is useful as a primer for synthesisting the polynucleotide and encoded for detecting the polynucleotide. The polynucleotide and encoded for detecting the polynucleotide. The polynucleotide and encoded for detecting the polynucleotide. The polynucleotide and encoded genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene thrapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, disease-related proteins are involved in tissue and/or cell cranscription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, reanscription-related proteins, disease-related proteins and genes concing them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is clone specific PCR primer which was used in the sequence data for this patent is not represented in the printed sequence data for this patent is not represented in the printed or proteins and proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Otsuki T, Wakamatsu A, Sato H, Ishii S;

The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. prheumatoid arthritis). The present DNA sequence represents a 2.-O-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to mouse TGF-beta receptor II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New compound having a sequence targeted to a nucleic acid encoding
Transforming growth factor beta-receptor II, useful for preparing a
composition for treating hyperproliferative disorder e.g., lung, liver,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ss; primer; cytostatic; antidiabetic; anorectic; cerebroprotective; neuroprotective; antiinflammatory; gene therapy; antisense therapy; thyromimetic; Novix; pathology; cancer; diabetes; obseity; endocrine disorder; CNS disorder; inflammatory disorder; chromosome mapping; tissue typing; predictive medicine.

. 0

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obssity, and candocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to a primer used to amplify and isolate the coding sequence for one of the polypeptides of

Example B; SEQ ID NO 535; 772pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of inhibiting corneal allograft rejection, by contacting the allograft with a topical formulation comprising an antisense oligonucleotide targeted to intercellular adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (WCAM-1). The oligonucleotide is useful for inhibiting corneal allograft rejection or for preserving a corneal explant ex vivo, where the explant is human. This sequence

The formulation is used for treating inflammatory bowel disease, e.g. ulcerative colitis, Croin's disease or inflammatory bowel disease, in animals (e.g. human). It can slo be used for treating undue cellular proliferation. The present sequence is an antisense oligonucleotide targetted to human intracellular adhesion molecule (ICAM-1) gene. This sequence is used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to an isolated antibody that binds to an epitope of an inducible human phosphofructokinase-2 (iPFK-2) isozyme. T antibody is useful for treating cancer, inflammation and cachexia. The antibody can also be used in enzyme linked immunosorbant assay (ELISA) immunological assays. The present sequence is S-iPFK-2 sense phosphorothioate oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA vaccine; flatfish rhabdovirus; HIRRV; fish; immunity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antibody that binds to an epitope of an inducible human phosphofructokinase-2 isozyme, useful for diagnosing or treating cancer,
                                                                                                                                                                                                                                                                                  cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an isolated antibody that binds to an epitope of an inducible human phosphofructokinase-2 (IPFK-2) isozyme. T antibody is useful for treating cancer, inflammation and cachexia. The antibody can also be used in enzyme linked immunosorbant assay (ELISA) immunological assays. The present sequence is AS-iPFK-2 antisense phosphorothicate oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (Lohl) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (Asi) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somaticels of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms present in the normal somatic cells, and the first gene. The products and methods can be
                                           The invention relates to a novel method for typing a single nucleotide bolymorphism (SNP) using a small amount of genomic DNA comprishing simultaneous amplification of plural base sequences containing one or more SNP sites and differentiation of the bases within the SNP sites. The method of the invention may be useful for typing several hundred thousand SNP sites using only a comparatively small amount of genomic DNA. The current sequence is that of the SNP typing-related PCR primer of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel DNA vaccine for flatfish rhabdovirus (HIRRV) infected fishes, which provides immunity against HIRRV. The vaccination method uses a DNA construct comprising a transcriptional-control sequence containing cytomegalovirus immediate-type promoter, operably coupled to a nucleotide sequence encoding an immunogenic polypeptic of HIRRV. The DNA vaccine has virucide activity. The HIRRV DNA vaccine is useful for administering to a fish belonging to the flatfish family by gene gun. The HIRRY DNA vaccine is useful for inducing preventing HIRRV infection in flatfish. The HIRRY DNA vaccine is effective in enhancing immunity of fish infected by HIRRV. This polymucleotide sequence represente an oligo used in the analysis of the mRNA expression level from the muscles of flatfish, following an innoculation with the flatfish rhabdovirus vaccine of the invention.
                                                                                                                                                                                                                                                                       DNA vaccine for flatfish rhabdovirus infected fishes has DNA construct comprising a transcriptional control sequence coupled to a nucleotide sequence encoding an immunogenic protein of flatfish rhabdovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype
                    cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometricsis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular diesase; coronary artery disease; forenaics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

use Ribozymes having modified bases and methods for producing them - for in inhibiting disease related genes.

Claim 2; Page 228; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nuclecided acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The reAA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their

```
ô
                 sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                    Gaps

Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

Example 9; Page 191; 218pp; English.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vaccular endothelial growth factor (WRGF). A patient (preferably human) having a condition associated with the level of the fms-like tyzosine kinase 1 (EL-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule arthritis) can be vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention

The present sequence represents a hybridisation probe used to differentiate between pathogenic and vaccine strains of cattle brucellosis. The method comprises digestion of DNA from the test strain with restriction enzyme Nco 1, transfer of the fragments obtained to filters, subsequent fixing of these onto the filters, hybridisation with a labelled sample, and examination of the results. (Updated on 25-WAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                           Differentiating pathogenic and vaccine strains of cattle brucellosis -
using restriction digestion with Nco 1 and transfer of the DNA fragments
to filters in an electric field.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tag sequence; colorectal cancer; pancreatic cancer; colon cancer; diagnosis; prognosis; treatment; ss.

The method comprises digestion of DNA from the test strain with restriction enzyme Nco 1, transfer of the fragments obtained to filters, subsequent fixing of these onto the filters, whybridisation with a labelled sample, and examination of the results. (Updated on 25-WAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Differentiating pathogenic and vaccine strains of cattle brucellosis -
using restriction digestion with Nco 1 and transfer of the DNA fragments

weethod (I) has been developed for generating, in the same reaction vessel, a selected set of codons (II). The method comprises providing two (optionally three) sets of monouncleosides, mononucleotides.

(optionally three) sets of these and optionally repeatedly adding a third set, where (II) includes at least one codon having A or G at the third set, where (II) includes at least one codon having A or G at the third set, where (II) includes at least one codon having A or G at the third set, where (II) includes at least one codon having a or a stop codon. Also described is a method (II) for generating an oligomucleotide from (II), comprising the method (II), followed by repeating the method or thin an oligomucleotide of the desired length is achieved. (I) and (II) are useful in care useful in particular the methods are useful in pharmaceutical research. In particular the methods are useful in pharmaceutical research. In particular the methods are useful in techniques, ribosome display techniques and protein-mucleic acid fusion techniques. Codon-randomised DNA can also be used in cellular cultures (In vivo) for protein expression, or for in vitro applications using, e.g. T7 RNA polymerase, and in vitro translation systems. The present sequence represents an oligomucleocide which is used in the cemplification of the present invention
                                                                                                                                                                                                                                           ö
obtain accurate sequence estimate. (I) is useful for a research and medical applications. (I) minimises extor rates in sequencing or testing nucleic acids. The present sequence represents an original DNA template which is used in the exemplification of the present invention
                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Acid/base orthological deprotection scheme 15-mer oligonucleotide #2

The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815, The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-19516). The method is useful for ameliotating the effects of psoriasis, ichthyosis, pityriasis, ruba, pitaris, serborrhoea, keloids, keratosis, chophanias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood

```
Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Action of the present inversions. The method comparises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keratosis, inchthyosis, pityriasis, varts, benign growths, canners of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for ameliorating the effects of

IGF-I oligonucleotide #1662

(first entry)

30-MAR-2001

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisomediacedride, (for Insulin-like Growth Factor [Gre]-1 creeptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

Inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the affects of psoriasis, oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, neoplasias, soleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, the brain or skin, growth factor—mediated malignancies, other sclerotic disease, kidhey disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                            Antisense therapy; antiproliferative; antinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF1; pityriasis; IGF binding procein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; necovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 15 BP; 7 A; 1 C; 5 G; 2 T; 0 U; 0 Other;

Ameliorating the effects of a disorder, e.g. psoriasis, by administering V (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

The present invention relates to a method for ameliorating the effects of antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present esquence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 olifothyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ineoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic meneral or strain and present of the inside of blood Example 8; Page 71; 201pp; English. vessels or any other hyperplasia

The present invention describes a method for detecting mutations associated with anti-HV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/IL, Y181CI, M184V/I, Y181E, C190A/S/R, T215Y/F/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V105M/IL, M181C/I, V181C/I, O151M/L, M184V/I, Y181E, G190A/S/R and/or C151SY/F/D/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of antiviral drug resistance or mutations associated with drug resistance of viruses containing RT genes. ABZ34642 represent HIV RT contains and probes which are used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptuse gene by using probes optimized to function together in a reverse-hybridization assay.
                                                                   Human immunodeficiency virus; HIV; reverse transcriptase; RT; enzyme; detection; mutation; anti-HIV drug resistance; polymorphism; resistance;

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (scrial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABKX1900-ABKX2770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                              AAT11971-84 are antisense oligonucleotides (ONS) against human expressed vertivities of at least 50 % of control (ISIS 2922 shown in APT11961). It was found that up to 4 internal mismatches could be tolerated without loss of antiviral activity. Antisense ONS targeting CMV DNA or RNA coding for the ISI, ISE or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONS may be modified to prophylaxis essistence and to increase their efficacy. Modifications include phosphorothicate backbones, alkyl and halogen-substituted sugar modelies at the 2' position. (Updated on 25-MAR-2003 to correct PF
New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide nucleic acid oligomers hybridisable to cytomegalovirus or papilloma:virus - are stable anti:sense molecules with high affinity for single stranded DNA, used for treating infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New oligomers are claimed which (A) have at least one peptide nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                              The sequences given in AAT32673-76 represent effective, and those in AAT32673-76 represent effective, and those in AAT32673-783 ineffective, anti-HIV Rev response element probes isolated from a hybritope probe pool. Hybritope mapping describes a method of determining superior sites for binding oligonucleotides to a target sequence, to identify improved discontinuous probes with high binding constants. The method comprises obtaining a series of oligonucleotides which are complementary to a known target sequence and which overlap each other by 1-4 mucleotides. Each of these sequences is contacted with the target sequence to permit specific hybridisation to determine presence or absence of specific hybridisation to determine oligonucleotides which bind within the known target sequence. This sequence was isolated using the probe sequences givne in AAT32670-72. The number of this probe corresponds to the 5' position on the HIV sf2 target to which the 3' end of the probe binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense; cytomegalovirus; CMV; human; therapy; prophylaxis; diagnosis; intermediate early complex; IE1; IE2; DNA polymerase gene; ss.
                                                                                                                           Detecting target binding oligo-nucleotide(s) - using oligo-nucleotide probes with a nucleotide sequence which binds within a known sequence of a target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (revised)
(first entry)
```

acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, 5 untranslated region, intron/exon (I/E) junction or coding sequence of curtanslated region, intron/exon (I/E) junction or coding sequence of hybridisable to the E, E2, E4, E5, E6, E7, L1 or L2 reading frames of a papillomavitus. The PNAs can be used to target RNA and single stranded DNA (scDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavitus processes and also as diagnostics (e.g., as probes for specific maNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which single strand binds with RNA or sabNA and a second RNA strand binds with the resulting double helix or with the first PNA strand binds with the resulting double helix or with the first PNA strand binds with the resulting double helix or with the first PNA strand change and are water soluble, which facilitates cellular upsake. Buther, shore they contain andes of non-blological amino acids, they are biostable and resistant to enzymatic degradation by processes. The present sequence targets CMV IE2 nuclear localisation

Sequence 17 BP; 0 A; 5 C; 3 G; 9 T; 0 U; 0 Other;

stability - useful for treating VEGF receptor(s) gene expression or mRNA rheumatoid arthritis, etc., in a human patient.

Claim 4; Page 61; 218pp; English.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a MRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV9721 to AAV98043 and AAV9899 to AAV9909090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98066 and AAV98867 to V9978 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell

Sequences AAV69693 and AAV69694 represent nested oligonucleotide probes corresponding to the exon 1 of the human glial cell line-derived neutrophic factor (GDNF) gene. These were used to identify the initiation of transcription of hGDNF gene. The invention relates to the use of the human GDNF promoter which contains a proximal section which cansures consistent low level GDNF expression in multiple cell types, and a distal section designed to alter transcription during development and in response to environmental stimuli. The GDNF promoter can be used for expressing GDNF in a cell, for identifying modulators and binding extrems of a GDNF promoter and modulators of GDNF expression. The products can be used for diagnosis and treatment of disorders involving GDNF such as neural degeneration, e.g. seizures, Parkinson's disease, Lou Gebrig GDNF during the prematal and neonatal stage. The GDNF promoter is also used for gene therapy and for expressing heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated glial cell line-derived neurotrophic factor promoter - used to develop products for treating e.g. neuronal degeneration, immunodeficiency, haemophilia or proliferative disorders such as cancers.
                                                                                  GDNF, glial cell line-derived neurotrophic factor; promoter; seizure; transcription; environmental stimulus; modulator; neural degeneration; Parkinson's disease; Lou Gehrid's disease; developmental defect; tumour; gene therapy; neural degeneration; immunodeficiency; haemophilia; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

New antisense oligonucleotides that target cytomegalovirus nucleic acid -
particularly including 2-methoxyethoxy sugar modifications, especially
for treating viral retinitis, with long-lasting retention in the retina.
                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotides (AAX17861-X17924) are targeted to a nucleic acid (AAX1792-X17948) encoding IE (immediate early) 1 or 2, or DNA polymerase of cytomegalovirus (CWV) and are able to inhibit CWV replication. Optionally the oligonucleotides include at least one 2'-(2-methoxyethoxy) sugar modification or phosphorothioate internucleotide Inkages. The oligonucleotides are used to inhibit CWV infections (by in vivo or in vitro contact with cells, tissues or body fluids), especially to treat or prevent CMV infections, particularly retinitis
Antisense; oligonucleotide; immediate early; DNA polymerase; CMV; cytomegalovirus; inhibition; replication; sugar modification; phosphorothioate; infection; retinitis; 88.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl nuclear transporter (ARVT) gene, an integrin submit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene, AAA16775 to AAA17651 to AAA17651 to AAA17652 represent ribozyme sequences for ARNT, and AAA17651 to AAA17652 represent ribozyme sequences for AAA19087 to AAA11675 to AAA19185 to AAA19185 to AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18087 to AAA19155 to AAA191822 represent their corresponding target sequences; AAA19155 to AAA191822 represent their corresponding target sequences; AAA19155 to AAA21501 and AAA21501 to AAA21595 to AAA21500 and AAA21595 to AAA21501 and AAA21501 to AAA21595 to AAA21500 and AAA21505 to AAA21505 and AAA2150 and AAA22475 and AAA22475 to AAA23262, AAA23342 represent their corresponding target sequences; for integrin subunit beta 3, and AAA23476 to AAA23262, AAA23343 to AAA23472 represent their corresponding target sequences; the invention are used for modulating target sequences. The ribozyme of the invention are used for modulating target sequences. The ribozyme sepecially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as anglofibrome of tuberous scilerosis, pot-wine stains, sturge Weber syndrome, and other syndromes and diseases related to the where any and arthritis, and arthritis, and arthritis, and any and arthritis, and a
                                                                                                                                                                                                                                                                                                    Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                                                                                                                                                                                  Coeshott C, Mcswiggen JA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               integrin subunit alpha-6, or integrin subunit beta-3

```

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(dilthicate link, having endonuclease activity. (A), and more generally any catalytic link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A/) that modulates expression of the oestrogen receptor. C gene, are used to treat cancer (particularly of breast or endometrium). In vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of estrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research resents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA2393 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences.

CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences.

CC AAA2593 to AAA26107 to AAA26218 represent their corresponding target sequences. and AAA26271 represent other ribozyme sequences and antennal and antisense oligonucleotides used in the exemplification of the present Sequence 17 BP; 5 A; 6 C; 4 G; 2 T; 0 U; 0 Other; Query Match Best Local Similarity

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 game and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a CD20 in the presence of a divalent cation that is preferably Mg^2+, cofficient and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more the cation prophoma, leukaemia, B-cell lymphoma, low-grade or follicular non-cleakagin's lymphoma (NLH), bulky low-grade or follicular non-cleakagin's lymphoma (NLH), bulky low-grade or follicular non-cleakagin's lymphoma (NLH), bulky low-grade or follicular non-cleakagin's lymphoma (NLH), immunocytoma (INC), small B-cell lymphocytic lymphoma (NCL), immunocytoma (INC), small B-cell lymphocytic lymphoma (NCC) craseting nucleic acid may be contacted with a cell coleave (CC crase central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, and/or other neurodegenerative disease teates which respond to the modulation of NOGO expertation of NOGO expertation of NOGO expertation of NOGO disease, muscular disease, dementian in ninozyme of the invent
                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence is an inozyme of the invention

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 30; Page 150; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down control acids acids eaving a suboxyme or a regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids and NGH motif), a G-cleaver (cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of cleaving RNA with a NGM with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of the cell and treat a patient having a condition associated with the level of CD20 in the teatment may further comprise the use of one or more the coll in particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Bodgkin's lymphoma (NRI), bulky low-grade or follicular NHI, lymphocytic lymphoma (NRI), timmunocytoma (IMC), small B-cell lymphocytic lymphoma, laukaemia, and inflammatory arthropathy. The NOGO targetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO gene in the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition? Sociated with the level of the ROGOT The treatment may further comprise the use of one or more creates which respond to the modulation of sisease, ctaxia, Hunthigton's di

The present sequence is a degenerate PCR primer used for amplifying the human cell cycle checkpoint protein, hohki DNA. The cell cycle checkpoint protein, hohki DNA. The cell cycle and timing of cell cycle transitions, and enaure that critical events such as DNA replication and chromosome segregation are completed with high fidelity. The chtl protein controls cell cycle in response to DNA damage. It functions as kinase and phosphorylates the key regulators of Cdk tyrosine phosphorylation. The checkpoint gene sequences are used as probes for a portion of the chromosome associated with tumours and other malignancies, as well as growth and/or development deficiencies. The chkl proteins are useful for generating specific antibodies and for inhibiting growth of
                                                                                                                                                                                                                                                                                                                                                                                    Human cell cycle checkpoint protein, hchkl DNA amplifying PCR primer #2.

```
The invention relates to a purified polynuclectide (I) encoding a protein sequence (II) encoded by a novel human gene, otoferlin (OTOF) or the long human otoferlin isoform in brain. (I) was identified as underlying an autosomal nonsyndromic prelingual deafness DRNB9, and is thus useful for detecting deafness disease in humans and for characterising the functions of proteins and genes encoding them in auditory function. AAS95022-AAS95048 represent human and mouse otoferlin coding sequences, PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart;

Human GDMLP-1 17-mer scanning SEQ ID NO:4 sequence SEQ ID NO:67.

(first entry)

29-MAY-2002

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 claim be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements and for case as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins or polymeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule capture probes for surface-enhanced laser describing deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence captured in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide, for raising antibodies that recognize hdDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descrption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Shannon ME;

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 claim be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids in samples, as amplification substrates to mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for provide initial substrates for the recombinant engineering of hGDMLP-1 proteins or polypeptides may be protein, variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1 may be used for chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this spatent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. The present invention.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
The present sequence represents an oligomer used in the screening of the hGDWLP-1 sequence in the exemplification of the present invention, N.B. The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be and/or amount specifically of hGDMLP proteins as specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describion ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines of for replacement therapy. The disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the rapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production with the expression of hGDMLP-1 in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from WIPO. The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used an genome therspy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describing in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and sequence encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 may be used for chromosome 22.

The present sequence represents an oligomer used in the screening of the horselfication, but was obtained in electronic format directly from WIPO capture, producincy production, but was obtained in electronic format directly from WIPO captured.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:8896.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 clan be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP proteins, as specifically of hGDMLP proteins, as specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser described in onisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The adjaced sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic acids encoding the protein, useful for treating subjects having defects in KTOM1 which can manifest as cancer of the kidney, or as a disorder of e.g., liver or bone.

Example 2; Page 179; 418pp; English.

The invention relates to a novel isolated nucleic acid encoding human KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTOM1 nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOM1. Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTOM1 which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan the nt 1-1001 portion of human KTOM1a (ABQ63232)

```
The present invention relates to human testis expressed Patched like
protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL
has two isoforms, with a few single base pair differences between the
two. One of the single base pair changes introduces a premature stop
codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
codon in HTPL-S (S for short) stop in HTPL plays a role similar
consideration and second second second second second second second to the similar
consideration male germ cell development, and the HTPL gene was
mapped to human chromsome 10912.1. HTPL and its coding sequence are
useful for diagnosing a disorder caused by mutation in HTPL, and in
therapy and manufacture of a medicament for treatment or prevention of
therapy and manufacture of a medicament for treatment or prevention of
therapy and manufacture of a medicament for treatment or prevention of
therapy and manufacture of a medicament for treatment or prevention of
therapy and manufacture of a medicament for adrenal, adult and
foretal liver, bone marrow, brain, kidney, lung, placenta, prostate,
skeletal muscle or colon function. HTPL proteins and mucleic acids are
clinically useful diagnostic markers and potenial therapeutic agents for
male infertility and cancer. The present oligonucleotide was used in an
example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated human testis expressed Patched like protein (HTPL), ussful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 17 BP; 1 A; 7 C; 3 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zhan J;
           New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic acids encoding the protein, useful for treating subjects having defects in KTOM1 which can manifest as cancer of the kidney, or as a disorder of e.g., liver or bone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated nucleic acid encoding human KTCM1 (kidney tumour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTCM1 nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTCM1. Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTCM1 which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan the nt 1-1001 portion of human KTCM1a (ABQ63232)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 0.8%; Score 13.4; DB 1; Length 17; Best Local Similarity 93.3%; Pred. The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV8762 and ABB9819 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structures strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in the useful for diagnosing a disorder caused by mutation in HTPL, and in the useful for diagnosing disorder caused by mutation of such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic agids are called infarility and cancer. The present oligomucleotide was used in an entered in an en
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous solerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, temporally, macular degeneration, the tumour angiogenesis, diabetic retinopathy, macular degeneration, necvascular glaucoma, myopic degeneration, arthritis, psoriasis, vertuce valaries, subjective solutions of the special portions of the relation of the patient having a condition associated with the level of ERG, by contacting a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies of the treatment of the conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treatment. (I) is useful for reducing ERG activity in a cell. by contecting the cell with (I). (I) is useful for cleaving RNA of the ERG gene, by contecting the cell with (I). (I) is useful for cleaving RNA of diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically trageting genes that share homology with ERG gene or ERG fusion genes. ABRZ7319 represent nucleic acids, including antisense and cenzymatic nucleic acid molecules which regulate expression of ERG, and cenzymatic nucleic acid molecules which regulate expression of ERG, and
                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide which down regulates expression of Bts-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, harbap-E. The products of the invention have abortive and contraceptive activity and can be used for generation to in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide on be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH2) in polypeptide (1), comprising a sequence of 730 amino acids (SI, ABB8399), a sequence having 65% sequence identity to (SI), acids (SI) having 95% deviations, especially conservative substitutions or a graph of the sequences comprising at least 8 contiguous amino acids. Human POSH1 1 is a proto-oncogene/Oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (II) is useful considered by altered expression of human POSH1 including diagnosing and creating cancer, they useful in the development of vaccines and treating treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonuclectide useful in examples of free invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to betwent by the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                   Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, FOSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (SL, ABB83999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring dispease and treating cancer, they useful in the development of vaccines and (II) is cuseful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to betwent by the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                         Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                               Example 2; SEQ ID NO 1805; 60pp + Sequence Listing; English.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBE3999), a sequence having 65* sequence identity to (SI), (G1) having 95* deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating encoding (I) are useful for diagnosing monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence difformation supplied to printed specification, but is based on sequence information supplied to browny and the present of the content of the present of the content of the present of the content of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, POSHL 1, SH3 domain, POSH-like signalling protein 1; oncogene;
Rho GTPase; signal transduction, gene expression; cancer; vaccine;
gene therapy; transgenic; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (61, ABB83999), a sequence having 65% sequence of 631), (61) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPaces as well as downstream components of the signal transduction pathway. (I) is useful cfor identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and creating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating cance useful in measuring and for surveying gene expression and creating present sequence is that of a scanning oligonuclectide useful in examples of the invention. Note: The present sequence did not form part of the content the provent of the content of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, FOSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated SH3 domain (POSH) -like signalling protein 1 (POSH1 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB3399), a sequence having 61$ sequence defaulty to (S1), (S1) having 95$ deviations, especially conservative substitutions or a tumm n POSH1 is a prote-omorgene/oncogene product that functions as an adaptor protein that interacts with Rho family small Greases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and mudicic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating canced by altered expression of human POSH1 including diagnosing and creating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating resents sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the prevent hy the Enventers before the sequence is that of a scanning on sequence information supplied to parament hy the Rivernan betain of the prevent which prevent hy the Rivernan betain the development of the sequence in the same of the parament hy the Rivernan betain the sequence information supplied to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
